

Episodes of Care – Exclusionary Diagnoses

At Centerstone, we encourage you to enter all diagnoses that a client may have along with any relevant Z-codes and other social determinant codes.

When considering an ADHD diagnosis, please be sure to fully document the symptoms and rule out any differential diagnoses. Trauma symptoms often present as similar to ADHD. We have provided the Vanderbilt Scales in Avatar to assist in determining symptoms for ADHD.

For Episodes of Care related to ADHD and ODD, many diagnoses from the following categories will remove the client's costs from the episode charged to Centerstone. Some exclusionary categories are limited to either ADHD or ODD as shown below. If you determine these diagnoses are relevant to your client and their symptoms and behaviors meet DSM-5-TR requirements, please add these to your client's diagnosis.

- Antisocial personality disorders (ODD)
- Attempted suicide or self-injury (T14.91XA, etc.)
- Autistic disorders (including Asperger's and other pervasive developmental disorders)
- Bipolar disorders
- Body dysmorphic disorders (ODD)
- Borderline Personality Disorder
- Bulimia nervosa (ADHD)
- Cognitive impairment disorders (ADHD)
- Conduct disorders (all)
- DCS Custody (add Z62.21 In welfare custody AND client alert In DCS Custody)
